A court let a plaintiff serve defendants it only knew as three wallet addresses. Proving it followed that order is still done by hand.

> "ORDERED, that plaintiff shall serve the summons, complaint, … together with a copy of this Decision and Order with Notice of Entry, upon defendants, within 120 days of the date of entry, by airdropping NFTs hyperlinked to a website containing copies of said pleadings to digital wallet addresses 0xD764…0B7d (Wallet 1), TCfr…1ss8 (Wallet 2), and TDvR…Ztmu (Wallet 3)" … "plaintiff shall file an affidavit of service … and service shall be deemed complete upon such filing."
>
> Sup. Ct. N.Y., Queens County, Index No. 700647/2025 (Lin, J.), order signed June 9, 2025, p. 6 · public record at ag.ny.gov

Some courts have ordered service by NFT. Proving you complied with the order is still manual. ServeChain does both: serve, then build a verifiable case file.

Replay of a public New York Attorney General case; the author is not a party to it.

HOW IT IS DONE TODAY

In the case replayed here, the proof was saved webpages.

Where courts have ordered it

Trial-level orders, not appellate rulings (this 2025 order was unopposed).

- *LCX AG v 1.274M U.S. Dollar Coin*, 2022 NY Slip Op 32834[U] (Sup Ct, NY County) token airdrop (the OAG memo calls it NFT)
- *Meghji v Wallet Owner (In re Celsius Network LLC)*, 666 BR 28 [Bankr SD NY 2024] NFT
- *People v Unknown Parties*, Sup Ct, Queens County, Index No. 700647/2025, reported as 2025 NY Slip Op 25143 (official text not retrieved) NFT

What the order asks for

Five conditions: a 120-day window, a specific document set, a specific method, three named wallets, and a filed affidavit. The response clock starts at filing. Counsel must show each condition was met; a gap can be raised against a default judgment.

In this case, at the motion stage (January 2025)

- A law-student intern sent the notices. His affirmation says a smart contract was created on an NFT platform; the exhibit shows a platform's shared ERC-721 token. TRON notices used separate contracts.
- Delivery was shown with **explorer and NFT-platform webpages** (Etherscan, Tronscan) attached to an affirmation.
- Nothing ties each page to the order condition it relates to, flags which conditions have no evidence yet, or fixes which papers were actually served.

Source: decision pp. 4-5; intern affirmation pp. 69-72 and exhibit p. 78; OAG memo p. 64 (LCX), all in the public PDF.

WHAT SERVECHAIN DOES

Serve, then build the verifiable case file.

1
Impracticability

Real defendant wallet activity, read only, beside the contact attempts the court relied on.

2
Conditions

The order becomes a checklist with exact quotes and page numbers. Its hash is fixed on-chain.

3
Serve

Hash the papers, mint one soulbound (non-transferable) notice per wallet per condition with that hash in `tokenURI`, link each tx to a condition.

4
Deadline

Filing is recorded once every service condition has evidence; + 30 days (CPLR 320(a) / 3012(c)). Shown as a New York calendar date, an estimate.

5
Summary & verify

One compliance summary PDF (attachment for counsel), A to C. Its hash is anchored. Browser or CLI says MATCH or MISMATCH.

Two contracts

`ServiceNotice721`: non-transferable notice, papers hash fixed at mint. `CaseFileRegistry`: conditions, evidence, deadline, snapshot.

Context, not evidence

Unattributed NFTs seen on the three real wallets on July 30, 2025 are shown as context only, not linked to any condition. ServeChain did not send them.

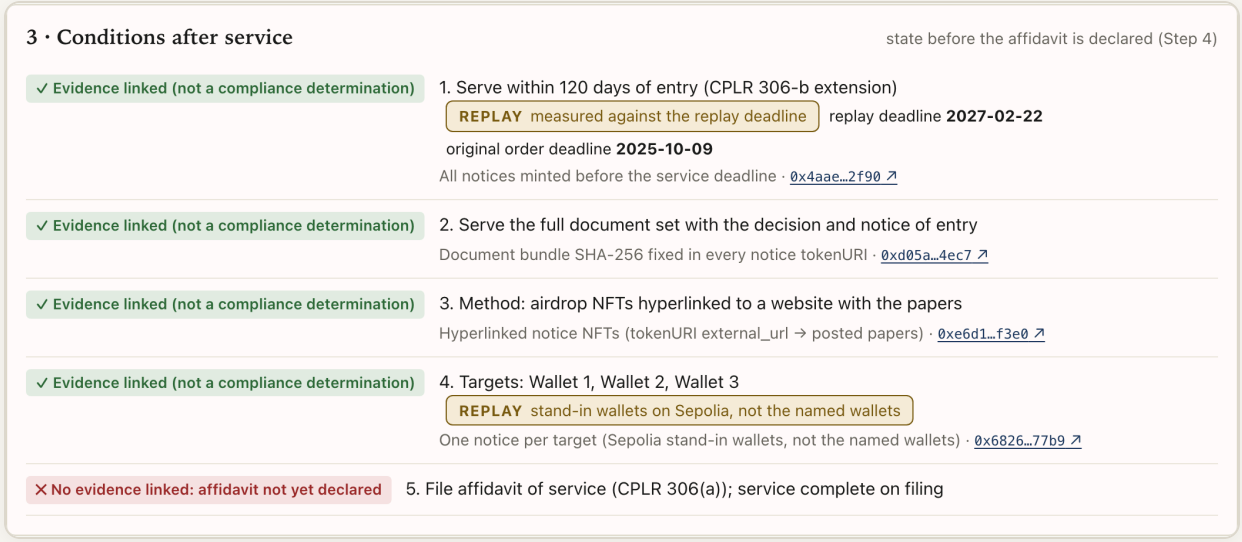

Guarded in scripts

Writes only on anvil (31337) and Sepolia (11155111), to labelled stand-in wallets. Real wallets are read only.

DEMO · LIVE ON SEPOLIA

All five conditions have evidence linked (not a compliance determination). One tampered byte is caught.

The order names two TRON wallets; this tool writes only to EVM chains, so in this replay they are served on Sepolia stand-ins.

Step 3 · after minting, condition 5 shows "No evidence linked" until the affidavit is declared in Step 4. Replay badges mark the deadline, stand-in targets and the on-chain affidavit record.

Step 5 (right) · the published compliance summary matches the hash anchored on Sepolia; a copy with one byte flipped does not.

WHY BLOCKCHAIN

Two layers, and they carry different weight.

1 Service is on-chain because the defendant only exists on-chain.

The wallet address is the only known contact point, and some courts have ordered service by token or NFT airdrop. ServeChain's notice fixes the SHA-256 of the papers inside the token, so it shows **what** was served, not only that a token arrived.

2 Anchoring the compliance record is added value, not a legal requirement.

Saved webpages and spreadsheets can be edited later. Evidence hashes, the declared filing time and the compliance summary hash on-chain mean the filer cannot quietly change their own record, and the other side can check it against the chain. No server of ours is needed to read it.

On-chain gives public reading, ordering and a non-transferable service NFT. It does not prove the facts behind a record, and a proof of time alone could come from an RFC 3161 timestamp. Courts still read explorers and affidavits; ServeChain organizes that proof, it does not replace it.

LIMITS

What it does not claim, and what it cannot do yet.

Does not claim

- To determine compliance. "Evidence linked" is not a finding.
- That a defendant received or read the papers.
- That wallet activity shows knowledge. It is context only.
- That default-judgment requirements are met.
- To be legal advice. Lawyer review is required.

Limitations today

- `declaredFiledAt` is entered by the filer. The chain cannot prove the court filing date.
- Deadlines are estimates (weekend and holiday rules not applied); on-chain filedAt + 720 h can be one day off the calendar date across DST.
- The registry records service as complete only after every service condition has linked evidence, and not dated before the last of it. It cannot check that the evidence is true.
- Snapshot shown via local replay. On Sepolia its gate opens at filedAt + 720 h (2026-11-24 08:46 UTC), before the last calendar day ends.
- The verifier trusts contract addresses in case.json; links are the handler's declaration.
- Writes are EVM only. TRON wallets are read, not served.
- Registry and notice contract are linked by the scripts, not on-chain.

WHO IT IS FOR

People who serve wallet-only defendants.

Plaintiff's counsel and process servers

Digital-asset fraud and recovery cases where the only known contact point is a wallet address.

Government enforcement offices

For example a state Attorney General's office, as in the case replayed here.

Bankruptcy trustees

Estates pursuing transfers to unidentified wallets.

Hypothesis: a per-case fee for counsel, or a tool licensed to process-serving firms.

No lawyer review or user interviews yet. Next step: practitioner interviews (not yet done) to test the workflow and the pricing.

ROADMAP

From one replayed order to everyday use.

TRON writes

Two of the three wallets in this case are on TRON. Mint the same hash-locked notice there.

Other jurisdictions

Rule sets beyond New York CPLR, such as service abroad by other means ordered by the court (FRCP 4(f)(3)), kept in one rules file with sources.

Weekend and holiday rules

Apply day-counting and roll-forward rules once read from the source, with the rule shown next to every date.

Court e-filing link

Attach the e-filing confirmation to the affidavit record so the filing time no longer rests on the filer's word alone.

Registry reads the notices

Link the registry to the notice contract on-chain, so service evidence no longer depends on the scripts recording each notice.

Korea: research item

How wallet-only defendants are served under the Civil Procedure Act (e.g. service by publication, Art. 194) is not yet analysed.

Open source (MIT). Reproduce with `forge test`, `npm test`, `npm run demo:local`, `npm run verify`.

WHO BUILT IT

Sabin Kim

Solo builder. Strategic planning in financial services.

I'm going through a lawsuit myself, and the procedural side, serving papers and keeping deadlines straight, felt more fragile than it should. ServeChain started from that.

Everything here was built for this hackathon: two Solidity contracts, a scripted demo on anvil and Sepolia, a compliance summary builder, and a browser and CLI verifier.
